## Overview

This brief compares the digital economy of Yucatán, Tabasco and Mexico from 2020 to 2024 in three dimensions: access, use and value. We used official microdata from INEGI's ENDUTIH survey, INEGI's national and state accounts, and OECD indicators. Estimates follow INEGI's sample design, and differences are reported only when significant at 90%. Our national estimates match the figures Mexico reports to the OECD in 7 of 8 measures.

## Findings

Yucatán leads the country in selling online: 20.5% of its internet users sold something in 2024, almost double the national 11.2%. It also ranks fourth in online buying (44.4%), and its use of online banking rose from 14.4% to 21.8%. This advantage comes from use, not infrastructure, since its share of connected households matches the national level.

Tabasco almost closed its access gap, with households online rising from 43.6% to 71.7%. However, buying, selling and online banking remain at or below the national average, and only 37.2% of its households have a computer.

Nationally, connectivity grows through smartphones, while households with a computer stayed at 44% for five years. E-commerce more than doubled its share of GDP, from 3.3% in 2013 to 6.9% in 2024.

## Recommendations

- Tabasco: train households and small businesses in digital commerce, payments and banking.
- Yucatán: support small businesses that already sell online, especially with logistics and payments.
- Mexico: promote computer access at home, the only access indicator that did not improve.

## Limitations

Figures are sample estimates, 2023 GDP and 2024 e-commerce data are preliminary, and state averages hide internal differences such as Mérida versus the rest of Yucatán.
